Price Impact or Trading Volume: Why Is the Amihud (2002) Measure Priced?

X. Lou, T. Shu, *Review of Financial Studies*, 2017 · replication on Binance

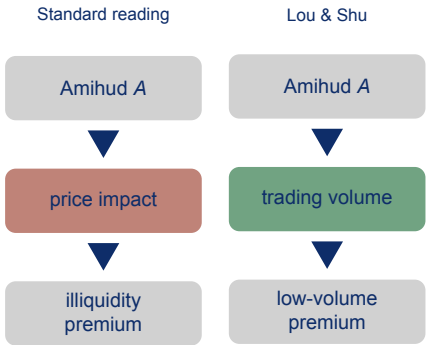

Group 12: Andrey Tsember, Sofia Shapovalova, Ksenia Stepanova, Marat Bineman, Alexia Fox

Moscow 2026

Problem

Illiquid stocks earn a premium.
Is it for price impact, or just for low volume?

$$A = \frac{1}{D} \sum_{d} \frac{|r_d|}{\mathrm{DVol}_d}$$

Amihud is almost only volume

0.899

corr(A, A_C) · US stocks, paper

0.956

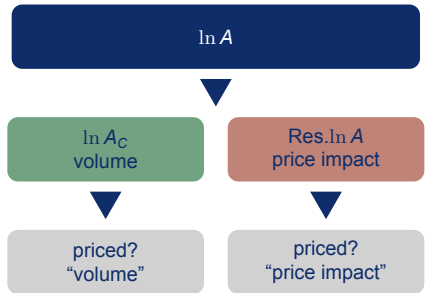

corr(A, A_C) · Binance, us

A_C keeps only $1/\mathrm{DVol}$, and it explains almost all of A.

Method: split Amihud in two

$$\ln A = a_t + b_t \ln A_C + \text{Res.} \ln A$$

If only the volume part is priced, the premium is about volume.

First, simulations

World V volume is priced	World P price impact is priced	World 0 nothing is priced
100% runs find A_C priced	100% runs find Res.$\ln A$ priced	9.5% false positives (target 5%)

The pipeline tells the hypotheses apart before we touch real data.

Dataset overview

Binance spot · USDT pairs

626 coins

93 months

24 628 coin-months

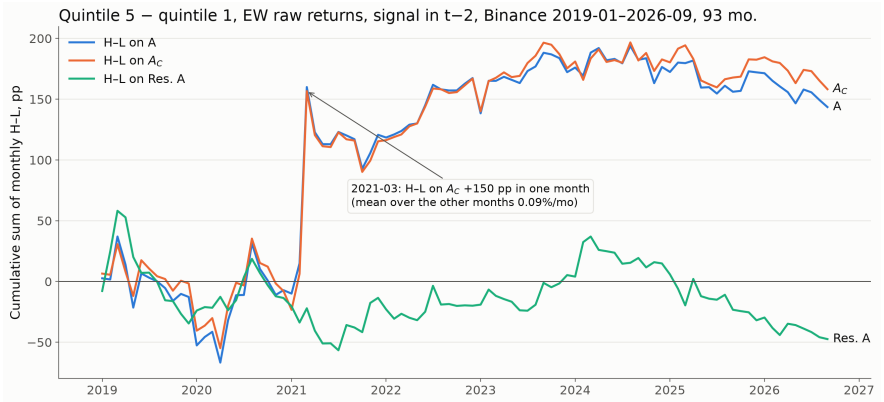

3 signals: A, A_C, Res.A

Data analysis: what differs from the paper

	paper	Binance
spread of A_C, Q75/Q25	116.60	9.40
corr(A, $\|Ret\|$)	0.489	−0.133
s.d. of monthly return	—	43.9%

Coins differ less in liquidity, move much more, and trade more when volatile.

One outlier month: March 2021

The altcoin season makes the volume spread. Without it: 0.09% per month.

Test design

month $t-2$
MEASURE

month $t-1$
SKIP

month t
RETURN

$$r_{i,t} = \gamma_0 + \gamma_1 x_{i,t-2} + \text{controls} + \varepsilon_{i,t}$$

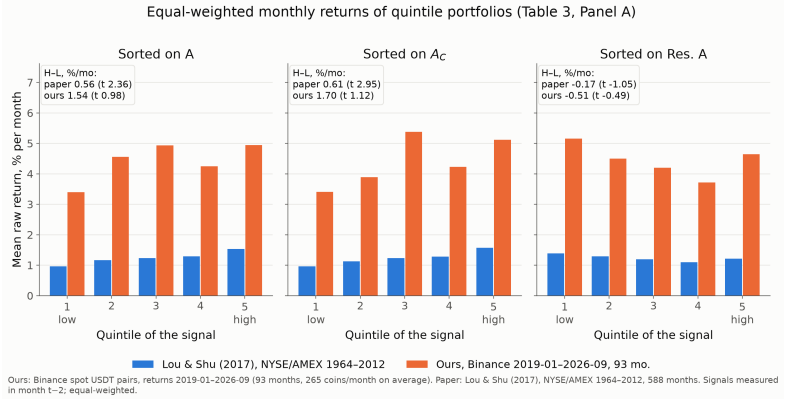

Quintile sorts and Fama–MacBeth, as in the paper.

The paper's result

H-L on A	H-L on A_C	H-L on Res.A
0.56 (t 2.36)	0.61 (t 2.95)	−0.17 (t −1.05)
%/month	%/month	%/month

Volume is priced, the rest is not: the premium is not for price impact.

Our replication next to the paper

Same signs, but noisy: H-L on A_C 1.70 (t 1.12).

The paper versus us

25/28
signs agree

8/21
significant results repeat

7.0×
smallest premium we could detect, vs the paper's

The direction replicates. With 93 months instead of 588, significance does not.

Upgrades

0.615
corr with 5-min λ
(paper 0.737)

98.8%
months with COV < 0
(Amihud & Noh premise)

2.57 (t 1.84)
sentiment long-short

0.308 (t 2.87)
$\ln A_C$ on MOEX

Amihud tracks true price impact, but no upgrade settles the debate.

Overfitting

16/73
tests pass 1.96
(3.65–5.7 expected by chance)

0
survive Bonferroni

2/11
stable in the bootstrap

Every test logged: our evidence is weak, and we say so.

Takeaways

Amihud is mostly volume.

The paper’s signs replicate on crypto.

Its significance needs more than 93 months.
